When you say from two plates – do you meet two different locations on a single slide or multi-well plate? If so that is definitely possible. This would be accomplished by using the ‘Applications’ > 6D > Define/Run Experiment

Then Click on Define/Run Experiment:
This is where you would set up the time lapse phases
This lambda tab is where the Fluorescence is selected.
Finally the XY Pos tab is where the different XY locations are set. From here just move the stage to the specific location and then click into the check box. This will automatically program the correct XY location, then move to the next location and click again.

The system will now take a fluorescence image at each of the XY locations and at the time sequence programmed in.
